MestReNova v14.2.1 Installation on PC
(updated May 2021)

Be sure to use the CofC secure connection (wireless works too).

1) On Windows 10, click on the startup button and select “This PC”. Go in the menu tab “Computer” and select “Map Network Drive”.  
   Alternatively, you can type `\Alchemist.cougars.int\Mnova` in the windows start menu.
2) In the Map Network Drive window, select a letter for your drive (any), type: `\\Alchemist.cougars.int\Mnova` in the Folder box, check “Connect using different credentials” and click on “Finish”.

![Map Network Drive Window](image)
3) In the Window Security window type the network credentials below: *(NOT your cougar account!)*:

In username type: `.232L` *(or 232L if that does not work)*
In password type: 232L

Click on Ok then Finish
You should now be able to access the folder “Mnova”.
4) In the Mnova folder, open the folder “Mnova14_newversion”.

5) Choose and click on the .msi extension file (32bits) to install MestReNova on your computer.

6) After the installation is complete, open the “licences_version14.2.1” folder, copy the 8 .lic files and place them in the following location on your computer:
   C:\Program Files (x86)\Mestrelab Research S.L\MestReNova\licenses

7) You should now be able to open and use MestReNova. If that does not work, you will need to copy/paste the license files to your desktop and then move them in the above folder.

Laptop users who want to use the software off campus must reconnect to campus network and relicense the software every 90 days. The server can be accessed via the wireless network using CofC secure connection.

Note: If you are running Windows 10 you might receive an error message regarding SMB 1, in that case open Windows Feature and tick all sharing SMB 1 options (3):

![Windows Features](Image)

And voilà!
